This POU was generated by the Ethernet Wizard for use with a CP 243-1 module at position 0. The ETHx_CFG (Reload Configuration) instruction causes the CP 243-1 module to read its configuration block from the location specified by the configuration table pointer.

Ethernet Wizard

This wizard will help you configure the CP 243-1 Ethernet module in order to connect an S7-200 PLC to an Ethernet network. Ethernet is based on the IEEE 802.3 standard, with communications protocols based on ISO and TCP/IP. The CP 243-1 module offers data transmission up to 100 Mbit/s over the network, and supports up to 8 concurrent connections.

Industrial Ethernet is designed for industry. It can be used with either noise-free industrial twisted pair (ITP) technology, or the Industry-standard twisted pair (TP) technology. Industrial Ethernet can be implemented to offer a wide range of application-specific uses such as switching, high-speed medium redundancy, fast connects, and redundant networks. Using the CP 243-1 module, the S7-200 PLC is compatible with a wide range of existing products that support Ethernet. Click 'Next' to configure a CP 243-1 module for your program.

Press F1 for help on any Wizard screen.

SIMATIC LAD

	Symbol	Var Type	Data Type	Comment
	EN	IN	BOOL

This POU was generated by the Ethernet Wizard for use with a CP 243-1 module at position 0. The ETHx_CFG (Reload Configuration) instruction causes the CP 243-1 module to read its configuration block from the location specified by the configuration table pointer.

Ethernet Wizard

This wizard will help you define the parameters for the CP 243-1 Ethernet module. The wizard will then place this configuration in your project.

Your project contains existing CP 243-1 Ethernet module configurations. To edit an existing configuration, select the configuration by its module position. Select 'New' to create a new configuration.

Configurations to Edit

Click 'Next' to edit this configuration.
